VoltBharat — India EV Insights Report

Registrations 2022-01 to 2026-09 (VAHAN fuel-type source); public charging stations: 2025 state snapshot. Generated 29 Oct 2026.

BEV registrations	EV share	BEV YoY (12 mo)	Public stations
95,43,592	7.48%	+42.4%	29,277
2022-01 to 2026-09	same period	to 2026-09	2025 snapshot

Observations

National BEV registrations, trailing 12 months. 32,01,718 battery-electric vehicles were registered in 2025-10–2026-09, up 42.4% from 22,47,991 in the preceding 12 months. [fuel]

EV share of new registrations. BEVs were 9.61% of all new vehicle registrations in the latest 12 months, compared with 8.1% a year earlier (+1.51 percentage points). [fuel]

Fastest-growing states (BEV, trailing 12 months). Highest year-over-year BEV growth among states with at least 1,000 BEV registrations in the comparison year: West Bengal +172.5% (64,102 → 1,74,654); Odisha +95.2% (72,588 → 1,41,724); Andhra Pradesh +90.9% (55,359 → 1,05,654). [fuel]

Highest EV adoption share. In 2022-01–2026-09, the highest BEV shares of new registrations were Tripura 14.01%; Delhi 12.1%; Assam 11.81%, against a national 7.48%. Tripura's share is 1.87× the national level. [fuel]

Geographic concentration. Five states — Uttar Pradesh, Maharashtra, Karnataka, Tamil Nadu, Rajasthan — account for 49.7% of the 95,43,592 BEV registrations in 2022-01–2026-09. [fuel]

Highest charging-infrastructure pressure. Using BEVs registered in 2022-01–2026-09 and the 2025 public-station snapshot, the highest BEVs-per-station ratios are Assam 986.1 (3.02× national); Bihar 974.6 (2.99× national); Tripura 678.6 (2.08× national). The national ratio is 326.0. This indicates potential pressure, not utilisation or coverage. [fuel, chargers_state]

Lowest charging-infrastructure pressure. The lowest BEVs-per-station ratios (states with at least 25 stations) are Nagaland 1.7; Arunachal Pradesh 6.5; Meghalaya 42.5. [fuel, chargers_state]

Monthly peak and latest month. The latest month, 2026-09, was also the highest in the period: 3,37,311 BEV registrations (+76.1% vs the same month a year earlier). [fuel]

EV share trajectory. Monthly BEV share of new registrations moved from 3.14% in 2022-01 to 13.13% in 2026-09. [fuel]

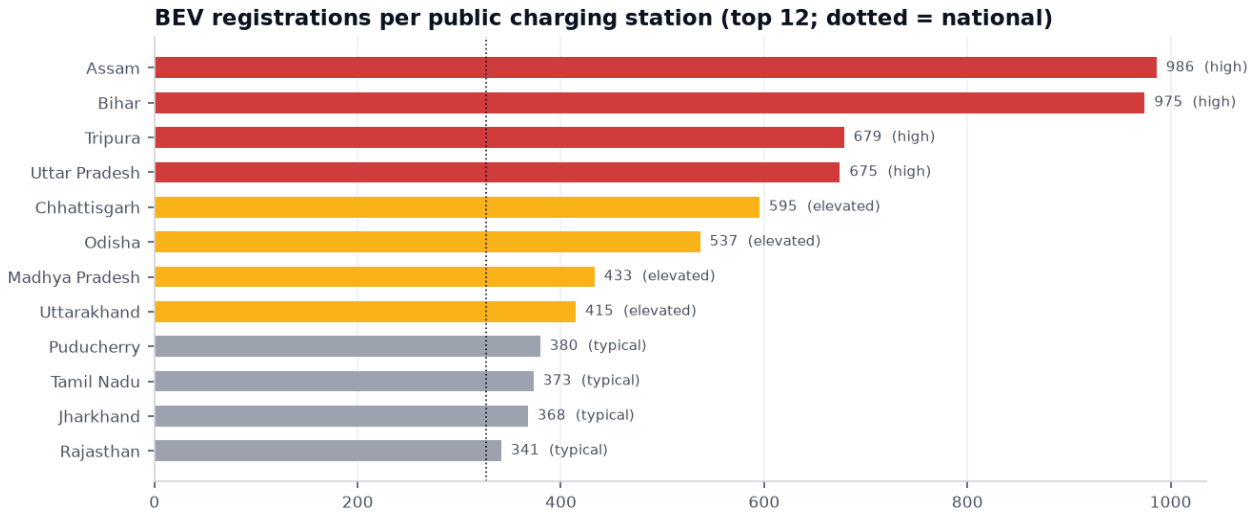

Electrified powertrain mix. Strong hybrids (2,53,771), plug-in hybrids (141) and fuel-cell vehicles (26) together equal 2.7% of BEV volume; they are reported separately and are not counted as EVs in headline metrics. [fuel]

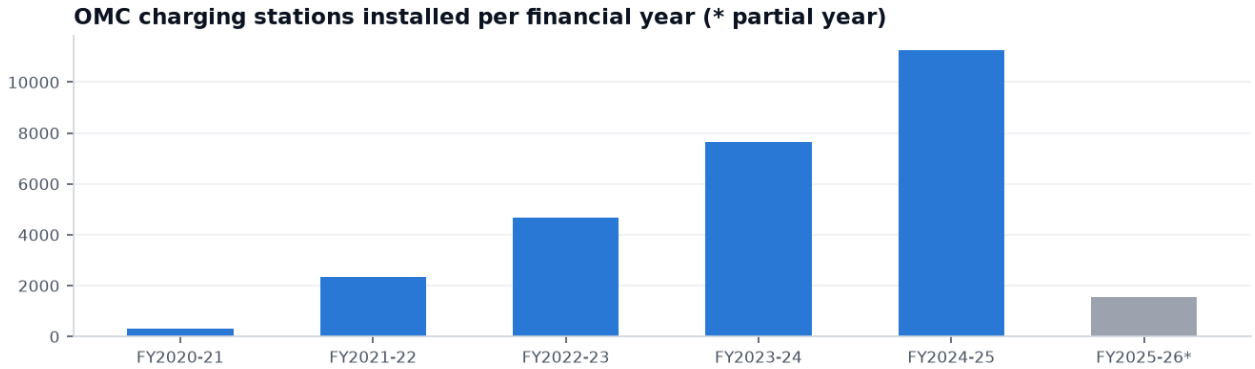

OMC charger installations. Oil marketing companies installed 11,246 stations in FY2024-25 vs 7,649 in FY2023-24 (+47.0%). Cumulative OMC installations reached 27,737, of which 22,753 are reported operational. [chargers_omc]

Manufacturer concentration (all fuels). The five largest manufacturers by ALL-FUEL registrations (Hero Motocorp LTD, Honda Motorcycle and Scooter India (P) LTD, TVS Motor Company LTD, Bajaj Auto LTD, Maruti Suzuki India LTD) hold 67.56% of all registrations. EV market share by maker cannot be computed from this source. [maker]

Charging infrastructure pressure

BEVs registered 2022-01–2026-09 per public station (2025 snapshot). A high ratio indicates potential pressure on public charging, not utilisation or coverage.

Recommendations

Prioritise charging-capacity reviews. Review public charging capacity first in Assam, Bihar, Tripura, Uttar Pradesh, Chhattisgarh: each has a BEVs-per-station ratio at least 1.25× the national level and growing BEV registrations.

Reasoning: A high ratio combined with rising registrations suggests demand on public stations may be growing faster than supply. Confirm with utilisation, charger-power and location data before investing; home and workplace charging are not captured here.

Study high-adoption states. Compare state policies and market structure in Tripura, Delhi, Assam with lower-share states to identify transferable measures.

Reasoning: These states show the highest BEV shares; the data cannot attribute this to any single cause.

Close the data gaps. Obtain registrations by fuel AND vehicle category (or by fuel AND maker) and a dated, point-level charger dataset with power ratings. These would enable EV segment analysis, EV market share by maker, and true accessibility metrics.

Reasoning: Current sources cannot separate EVs by category or manufacturer, and the charger data is a single state-level snapshot.

Data notes

• registrations-by-fuel-type.csv and vehicle-registrations-by-fuel-type.csv are byte-identical; only one is used.

• Office HR207 (M/S Pasco Motors LLP, Haryana) is excluded: its values equal the sum of all other offices (a national aggregate) for Jan-2022 to May-2024.

• State names are standardised through a documented mapping table; unknown names stop the pipeline.

• Category values that repeat across ≥3 offices in a month, or exceed 10× the office's median (and ≥1,000), are removed; states whose cleaned totals differ from the fuel source by more than 5% are excluded from category views.

• No missing months are imputed or interpolated.

• Policy associations are not causal. EV segment and EV-by-maker splits are not available from these sources.
